

FL-01 — AI Workflow Audit

Track: General AI Fluency **Phase:** Onboarding / Setup **Workload:** 4 hours

Purpose: This audit maps recurring tasks from my real week across study, technical projects, work, and side projects, and identifies where AI should collaborate, be delegated work with review, automate repetitive work, or remain outside the decision loop.

1. Recurring Workflow Audit

#	Recurring task	Classification	Why
1	Researching AI/ML + IoT project ideas and narrowing them into feasible final-year projects	Collaborate with AI	AI can generate and compare ideas quickly, but I need to judge feasibility, hardware availability, originality, and academic value.
2	Building AI/ML project notebooks and baseline models	Collaborate with AI	AI can help with code, debugging, and experiment design, but I need to understand the model and verify the results.
3	Designing and developing my e-commerce website	Collaborate with AI	AI can accelerate development, while I make architecture, product, security, and deployment decisions.
4	Writing prompts for AI coding tools such as Claude and Antigravity	Delegate to AI with review	AI can structure and improve prompts, but I need to check that the requirements match my actual project.
5	Researching APIs and integrations such as payment and delivery services	Delegate to AI with review	AI can compare integration approaches, but I must verify current API documentation and requirements.
6	Creating product descriptions and e-commerce content	Delegate to AI with review	AI can create first drafts quickly, while I check accuracy, claims, pricing, and brand voice.
7	Preparing professional emails and monthly work reports	Delegate to AI with review	AI can structure and polish the writing, but I must verify all facts, numbers, and activities.
8	Formatting customer addresses and delivery information	Fully automate	The task follows predictable formatting rules and can be standardized with very little judgment.
9	Learning AI concepts such as responsible AI, autonomy, and adaptability	Collaborate with AI	AI can explain concepts and give examples, but I need to question, practice, and verify my understanding.
10	Deciding which project or business idea I should actually pursue	Just me	This depends on my priorities, resources, risk tolerance, and long-term goals, so AI should advise rather than decide.
11	Making the final decision on whether an AI-generated result is trustworthy enough to use	Just me	I remain responsible for checking evidence, accuracy, security, and consequences before using the result.
12	Creating and improving project architecture and technology stacks	Collaborate with AI	AI can identify trade-offs and alternatives, but I need to choose based on constraints and maintainability.
13	Debugging website and project code	Collaborate with AI	AI can identify likely causes and fixes, but I need to reproduce the issue and verify the solution.
14	Searching for internships, opportunities, notifications, and relevant programs	Delegate to AI with review	AI can reduce search time and summarize opportunities, but I need to verify eligibility, deadlines, and authenticity.
15	Planning my weekly technical learning and project work	Collaborate with AI	AI can turn my goals into a plan, but I need to adjust it to my real workload and progress.

2. Three Target Tasks for FL-02 through FL-04

Target 1 — AI/ML Project Research & Scoping

Use AI to research potential AI/ML + IoT projects, compare alternatives, and turn one idea into a technically feasible project scope.

Done well: Compare at least 5 approaches; document advantages, limitations, hardware/software, and complexity; verify at least 3 technical sources; clearly define problem, inputs, outputs, ML component, IoT component, and evaluation metric.

Success metric: Produce a one-page project specification without major unanswered technical questions.

Target 2 — AI-Assisted Coding & Debugging

Use Claude or ChatGPT as a coding partner for implementation, debugging, and code improvement.

Done well: Test AI suggestions; record the reason for significant changes; verify tests/output; understand the changed code; reduce debugging time without reducing understanding.

Success metric: Each debugging session records problem → AI hypothesis → change → test result, with the final solution working on the actual project.

Target 3 — E-commerce Development Workflow

Use AI to help build and improve the e-commerce application across frontend, backend, authentication, database, storage, payments, and integrations.

Done well: Convert requirements into implementation tasks; keep code consistent with architecture; handle security-sensitive components carefully; test changes; retain human control of production decisions.

Success metric: A feature is done only when implemented, tested, integrated, and documented sufficiently for maintenance.

3. Claude Project Configuration

Project name: AI & Project Development

Custom instructions: Act as a thoughtful AI collaborator. Explain technical concepts practically; connect examples to my projects; explain important code changes; do not invent facts or APIs; distinguish facts, assumptions, and recommendations; flag information requiring verification; challenge weak ideas; identify security, scalability, reliability, and maintainability concerns; provide alternatives and trade-offs; help me understand reasoning. Use a clear, direct, practical, professional tone. My goals are AI fluency, strong AI/ML and IoT projects, software engineering skills, e-commerce development, better evaluation of AI outputs, and responsible use of AI. I remain responsible for decisions, verification, security, and final outcomes.

4. Evidence Checklist

Add real screenshots for: Claude account; ChatGPT account; Anthropic Academy account; enrollment in AI Fluency: Framework & Foundations; completion of the first module; configured Claude Project.

Important: The screenshots must be real evidence and should be added before final submission.
